

React – Ex – Components Communication

Create a (parent) component with movies data as follows (copy-pase it to your code) :

```
[{id : 1 , name : "Under the Dome", pic :  
"https://static.tvmaze.com/uploads/images/medium_portrait/81/202627.jpg"},  
{id : 2 , name : "Person of Interest", pic :  
"https://static.tvmaze.com/uploads/images/medium_portrait/163/407679.jpg"},  
  {id : 3 , name : "Bitten", pic :  
"https://static.tvmaze.com/uploads/images/medium_portrait/0/15.jpg"}]
```

The parent component has a movies combox (that will be **build at run time**).

Each movie selection will pass the name and the picture path to a “movie” child component that will present the given data
